

Project Management

Knowledge & Experience to Get the Job Done

Veolia Environmental Services Mechanical Services (VES) staff has a thorough knowledge of, and broad experience in, estimation of refinery and petrochemical plant maintenance and construction, including exchangers, tanks, pressure vessels and piping.

VES will assist you in the development of a detailed estimate, work schedule, work program and cost control system for each project. The scope and associated cost of individual projects may vary since each project plan is “custom-designed” to fit your needs.

Your detailed estimate will provide an approximation of the total direct, indirect and supervision hours, equipment requirements and costs associated with the project. This estimate will be formatted to provide a project budget which conforms to the project work breakdown structure and work schedule.

The work schedule will provide a project planning and control tool that includes estimated hours and/or cost budget information. This planning tool will be detailed at the appropriate level for use by your project staff for their planning and cost tracking

purposes. It will be appropriately coded to allow summary reporting to various levels of management.

The detailed work package is a step-by-step expansion of the project work schedule and is the planning tool necessary for the field foreman to complete his work. VES will assist you in identifying and formalizing the detailed activities required to meet the work schedule. The detailed work package includes and references all necessary procedures required to complete the work.

At VES, safety is part of our operating culture and is integrated into every phase of our project management services. We will work with your managers and safety departments to identify hazards in the proposed work and to develop detailed procedures to minimize them.
